<|end\_of\_text|>The dBi specification is based on the decibel , a logarithmic measure of relative power . Suppose an antenna A produces an electromagnetic field of intensity  $I_A$  microwatts per square meter (  $I_A \hat{=} \mu\text{W}/\text{m}^2$  ) in its favored direction at a point located some distance away. Also, suppose an isotropic antenna Q produces an electromagnetic field of intensity  $I_Q \hat{=} \mu\text{W}/\text{m}^2$  at the same distance. Then the gain G of antenna A , in dBi, is:
