

domain,â commented Benmoussa. âThe A380 enters into service with its nose wheel steering system control loop only tuned with LMS Imagine.Lab AMESim. Tests were performed to confirm the good system performance.âFor more information on AMESim and Imagine.Lab Ground Loads software from LMS Ltd., Troy, Mich., call (248) 952-5664, or visit [www.lmsintl.com](http://www.lmsintl.com).<|end\_of\_text|>

December 11th, 2005, 06:30 AMâHi, I was wondering if any one could point me in the right direction for programming system files. The reason I am interested in this is because I was just wondering when they are called how/what runs them. I know the system runs them but if i make a batch file and name it .sys if i try to run it I would get a message asking me what I want to use to run the file why is that, why doesn't the system try to run it and crash.â

December 12th, 2005, 09:17 AMâ"Traditionally" (in DOS and Win 3.x era) MS had actually 3 types (I think) of .SYS files.âThe first one is
