

the meteorites that fell to Earth, which are dated between 180 million and 1.4 billion years old, did not. Scientists conclude that Mars's ancient oxygen-rich atmosphere thrived more than a billion years before Earth and they believe that a major event ripped apart the atmosphere about four billion years ago. By comparing ratios of argon gas on both Mars and Earth, scientists predict that a huge catastrophic event changed their relative amounts at similar times. According to researchers, a likely event known as subduction occurred. The oxygen rich material on Mars's surface might have been drawn into the planets interior and regurgitated to the surface as eruptions hexed the planet. Now the question is being asked "Can the same demise that impacted Mars ultimately destroy the atmosphere of our planet Earth?" FREE online report shows how we can save America through a nutrition health care revolution. "Eating healthy is patriotic!" Click here to read it now... Healing Power of Sunlight and Vitamin D In this exclusive interview, Dr. Michael Holick reveals fascinating facts on how vitamin D is created and used in the human body to ward off chronic diseases like cancer, osteoporosis, mental disorders and more.
