one side and dull or splotchy coloration on the other, Nancy Greig, director of the Cockrell Butterfly Center at the Houston Museum of Natural Science, told Weather.com. When they land and close their wings, they take on the size, shape and shades of a leaf. COther bugs are camouflaged to make capturing food easier, Greig said. Leaf mantises fall into this category. âGlThey are sit-and-wait predators, âGL said the plant ecologist, who has studied insects for decades. âGlThey just sit there looking like a leaf until some insect that doesnâGLt see them comes along.âQLCThe mantis could be a brown, rotting leaf, like the dead leaf mantis, or a healthy vibrant one, like the green leaf mantis. Or it could look like a blossom. âGlOne we get sometimes is called the orchid mantis, which is

for protection against predators, like in the case of some butterflies. Many species, such as the painted lady and the Monarch, have bright coloration on

like a blossom. âÇlOne we get sometimes is called the orchid mantis, which is white or pink,âÇl: Greig added. âÇlIf itâÇls in a flower, you canâÇlt even see it. ItâCls incredibly camouflaged.âClĊ(MORE: The Most Painful Insect
